

ZF3 - Call Stacks

→ controller and action instances are selected in this step.

→ make a SecuredActionController from here.

→ user defined controller class

Facebook / Google

- Make a controller, and actions - sign-in register
- User only need to define route
- Actions such as Sign-in, Register, should be abstract so that users can override its view.

Secured Action Controller

- override dispatch method to check for authentication identity.

Authorization

- Application should authorize user by allowing/denying user accesses to controller/action at infrastructure layer.
- From application perspective, user should be authorized their access to features; However these roles/permissions should be transformed to controller/action at the infrastructure layer in Zend Framework.
